Feedback for DeskBeam POC Schematic:

- Extremely neat schematic
    - Easy to trace and understand where the connections are being made
    - Used many labels and not direct lines for clarity
    - Notes in the boxes are a nice touch
- 5V and 3.3V have input symbols instead of output symbols
    - 

    - Is this on purpose? The 5V input can power the ESP32, but the 3.3V input at the same time can damage it
- In the buck converter, the (assumed) output of 5V_VOUT has the input symbol
    - 

- There's a mention of an LED in multiple places. Is it included in the POC?
- From the Push Buttons, they go into GPIO 21 and GPIO 22, but there's no connection to them on the ESP32

- 

- Is this 5V input the same as the 5V_VOUT on the buck converter?
- 

- Might need pullup resistors for buttons and SCL SDA GPIO pins
- Overall AMAZING work
